

Neighbourhood section, reimagined

Four options for the "**Surrey Context**" block on the property detail page. Every data point shown already exists in **GET /neighbourhoods/:slug/detail** — livability score with four-dimension breakdown, provincial percentile, market snapshot, named POIs with distances, and personalization. No new backend work is required for options A–C.

WHY REDESIGN

- Walk Score and Lifestyle Score fall back to hardcoded values (80 / 8) — most listings show identical numbers
- "Very Walkable" is repeated in both cards
- "View full profile →" is a dead link (href="#")
- The rich neighbourhood-detail API goes unused on the PDP

THE FOUR OPTIONS

- **A · One livability system** — embed the neighbourhood page's dark livability panel
- **B · Score dial + market pulse** — livability ring plus a four-stat market strip
- **C · What's actually nearby** — named POIs and distances from this home
- **D · Why this area fits you** — personalized match with reason and caution chips

OPTION A

One livability system

Replace the two generic score cards with the exact livability panel from the neighbourhood page — big score, "Top X% in BC" rank, and the four sub-score bars. The section becomes a preview of the full profile, so "View full profile" feels like zooming in rather than jumping to something unrelated.

OPTION B

Score dial + market pulse

Keeps the light, airy card language but adds the thing buyers ask next: what does this area cost and how fast does it move. A livability dial with the four-dimension breakdown, and a market strip (median price, 30-day trend, days on market, active listings) pulled from the same endpoint.

OPTION C

What's actually nearby

Makes the section about this home, not abstract numbers: named places with walking distances from the property (schools, transit, parks, shops), POI markers on the map, and one slim score bar that compresses livability into a single row instead of two whole cards.

OPTION D

Why this area fits you

Brings the neighbourhood page's personalization card onto the listing: match percentage against the buyer's saved priorities, reason chips, and honest caution chips. Signed-out visitors get the cold-start variant ("What stands out here") with a sign-in prompt — same behaviour as WhyItFitsCard today.
